

ABSTRACT

METHOD AND APPARATUS FOR THE GENERATION
OF COMPUTER GRAPHIC REPRESENTATIONS OF INDIVIDUALS

5 Apparatus for generating computer models of
individuals is provided comprising a booth (1) that is
connected to a server (2) via the Internet (3). Image
data of an individual is captured using the booth (1) and
a computer model corresponding to the individual is then
10 generated by comparing the captured image data relative
to a stored generic model. Data representative of a
generated model is then transmitted to the server (2)
where it is stored. Stored data can then be retrieved
via the Internet using a personal computer (4) having
15 application software stored therein. The application
software on the personal computer (4) can then utilise
the data to create graphic representations of an
individual in any one of a number of poses.
